Business Analyst Case Study

Scenario

You have joined our cement manufacturing company as a Business Analyst. Management wants a Power BI dashboard to monitor business performance and support decision-making. You have been provided with sales-related data and are expected to analyze it and present meaningful insights.

Dataset

You will be provided with one or more datasets containing information such as:

- Date
- Sales Representative
- Location
- Dealer/Retailer Name
- Product
- Order Quantity
- Sales Amount

The dataset may consist of multiple tables. Create the required relationships if necessary.

Task

Using the provided data, develop an interactive Power BI dashboard that includes relevant KPIs and visualizations. At a minimum, your dashboard should cover:

- Overall sales performance
- Order quantity
- Sales by Location
- Sales by Sales Representative
- Sales trend over time
- Top-performing dealers/customers

Include appropriate slicers (e.g., Date, Location, Sales Representative, Product) to allow users to interact with the report.

You are encouraged to add any additional visuals or KPIs that you believe would help management better understand the business.

Business Analysis

Based on your dashboard, answer the following questions:

1. Which location is performing the best?
2. Which sales representative has the highest performance?
3. Which dealers/customers contribute the most to sales?
4. What key trends or patterns do you observe?
5. What recommendations would you make to improve business performance?

Evaluation Criteria

Your submission will be evaluated based on:

- Understanding of the data
- Data modeling and relationships
- Power BI dashboard design and usability
- Use of basic DAX measures
- Quality of business insights and recommendations
